

QUANTUM CHANNELS & OPERATIONS

GUIDED TOUR

Michael M. Wolf

July 5, 2012

These notes are based on a course given at the Niels-Bohr Institute (Copenhagen) in 2008/2009.

Most passages are still cryptic, erroneous, incomplete or actually missing. The notes are occasionally updated. Since they contain also some unpublished observations, please let me know if you want to use them ...

Contents

1	(De)constructing quantum mechanics	7
1.1	States and Observables	7
	Preparation and Measurement	7
	States as density matrices	8
	Measurements	11
1.2	Composite systems & entanglement	12
1.3	Evolutions	15
	Closed systems and reversible evolutions	15
	Open systems and irreversible dynamics	17
	Probabilistic operations and Instruments	19
1.4	Linearity and locality	20
	Non-linear evolutions and mixed state analyzers	21
	A sequence of impossible machines	22
	The quantum Boltzmann map	24
1.5	Do we need complex numbers?	24
1.6	The algebraic framework	25
	A glimpse beyond ‘Hilbert-space-centrism’	25
	Algebras in a nutshell	26
	Finite dimensional $\ast$ -algebras and conditional ex- pectations	29
	Duality and (complete) positivity	30
1.7	Literature	32
2	Representations	33
2.1	Jamiolkowski and Choi	33
	Implementation via teleportation	35
2.2	Kraus, Stinespring and Neumark	36
	Stinespring and the open-system point of view	38
	Neumark’s representation of POVMs	40
2.3	Linear maps as matrices	41
	More operator bases	43
2.4	Normal forms	47
	Qubit maps	49
2.5	Literature	51

3	Positive, but not completely	53
3.1	n -positivity	54
3.2	Positive maps and entanglement theory	56
	Detecting entanglement	57
	Entanglement distillation	60
3.3	Transposition and time reversal	60
3.4	From Hilbert's 17th problem to indecomposable maps	63
3.5	Preservation of cones and balls	65
3.6	Complexity issues	67
3.7	Literature	67
4	Convex Structure	69
4.1	Convex optimization and Lagrange duality	69
	Conic programs	69
	Semidefinite programs	70
4.2	Literature	71
5	Operator Inequalities	73
5.1	Operator ordering	73
5.2	Schwarz inequalities	75
5.3	Operator convexity and monotonicity	78
	Functional calculus	78
	Operator monotonicity and operator convexity	79
5.4	Joint convexity	84
	Joint operator convexity	84
	Jointly convex functionals	86
5.5	Convexity and monotonicity under the trace	87
	Trace inequalities	87
5.6	Operator means	89
6	Spectral properties	91
	Location of eigenvalues:	91
	Spectral decomposition:	92
	Resolvents:	95
6.1	Determinants	96
6.2	Irreducible maps and Perron-Frobenius theory	99
	The peripheral spectrum	103
6.3	Primitive maps	105
6.4	Fixed points	110
6.5	Cycles and recurrences	116
6.6	Inverse eigenvalue problems	118
6.7	Literature	118

7 Semigroup Structure	119
7.1 Continuous one-parameter semigroups	119
7.1.1 Dynamical semigroups	119
Continuity and differentiability	119
Resolvents	121
Perturbations and series expansions	121
7.1.2 Quantum dynamical semigroups	122
7.2 Literature	128
8 Measures for distances and mixedness	131
8.1 Norms	131
Variational characterization of norms:	133
8.2 Entropies	134
8.2.1 Information theoretic origin	134
8.2.2 Mathematical origin	134
8.2.3 Physical origin	134
8.3 Majorization	134
8.4 Divergences and quasi-relative entropies	138
8.4.1 χ^2 divergence	139
8.4.2 Quasi-relative entropies	140
8.4.3 Fidelity	141
8.5 Hypothesis testing	141
8.6 Hilbert's projective metric	145
8.7 Contractivity and the increase of entropy	148
Trace norm	148
Hilbert's projective metric	150
Asymptotic convergence and ergodic theory.	153
8.8 Continuity bounds	158
9 Symmetries	159
10 Special Channels	161
11 Quantum Spin Chains	163
